When the user first visits the website, they will be greeted by the warm colors present throughout, creating a very welcoming experience. We also have a font that borders on being playful but also very concise and professional-looking. When looking at the navbar, the user should have everything they need to reach every page of the website. It is designed with the ease of use of the visitor in mind. The text used throughout is sufficiently large for the user to see everything without having to go back and reread it. The same applies to the buttons that are also substantially large. Together, this makes it easier to navigate throughout all the pages on the website, as well as navigate to the external resources we have.

The information is presented in the website in such a way that anything is just one click away. There is no need to navigate back and forth to find what the user is looking for. Many objects such as restaurant locations and job applications follow that idea by being present on their respective pages as well as the home page. The website does not really encourage users to navigate away from the website to another page.
